SETD2-related syndrome
This guide is not meant to take the place of medical advice.

Please consult with your doctor about your genetic results and health care choices. The information in this guide was up to date at the time it was written in 2019. But new information may come to light with new research. You may find it helpful to share this guide with friends and family members or doctors and teachers of the person who has SETD2-related syndrome.
What is SETD2-related syndrome?

SETD2-related syndrome happens when there are changes to the SETD2 gene. These changes can keep the gene from working as it should.

Key role
The SETD2 gene controls the activity of other genes and is important for brain function.

Symptoms
Because the SETD2 gene is important in the development and function of brain cells, many people who have SETD2-related syndrome have:

- Intellectual disability
- Speech delay
- Larger head size
- Obesity

This syndrome is also called SETD2-related overgrowth syndrome because it is similar to a group of syndromes known as overgrowth conditions. These include Sotos syndrome and Weaver syndrome. Sotos syndrome has been linked to changes in the NSD1 gene, and Weaver syndrome has been linked to changes in the EZH2 gene. People who have overgrowth syndromes often have a large head and weigh more than is usual for their age. Some people also have an unusual facial appearance, learning difficulties, and intellectual disability.
What causes SETD2-related syndrome?

Our genes contain the instructions, or code, that tell our cells how to grow, develop, and work. Every child gets two copies of the SETD2 gene: one copy from their mother, from the egg, and one copy from their father, from the sperm. In most cases, parents pass on exact copies of the gene to their child. But the process of copying genes is not perfect. A change in the genetic code can lead to physical issues, developmental issues, or both.

Sometimes a random change happens in the sperm or egg. This change to the genetic code is called a ‘de novo’, or new, change. The child can be the first in the family to have the gene change.
De novo changes can take place in any gene. We all have some de novo changes, most of which don’t affect our health. But because SETD2 plays a key role in development, de novo changes in this gene can have a meaningful effect.

Research shows that SETD2-related syndrome is often the result of a de novo change in SETD2. Many parents who have had their genes tested do not have the SETD2 gene change found in their child who has the syndrome. In some cases, SETD2-related syndrome happens because the gene change was passed down from a parent. This is called dominant inheritance.
Why does my child have a change in the SETD2 gene?

No parent causes their child’s SETD2-related syndrome. We know this because no parent has any control over the gene changes that they do or do not pass on to their children. Please keep in mind that nothing a parent does before or during the pregnancy causes this to happen. The gene change takes place on its own and cannot be predicted or stopped.
What are the chances that other family members or future children will have SETD2-related syndrome?

Each family is different. A geneticist or genetic counselor can give you advice on the chance that this will happen again in your family.

The risk of having another child who has SETD2-related syndrome depends on the genes of both birth parents.

- If neither birth parent has the same gene change found in their child, the chance of having another child who has the syndrome is on average 1 percent. This 1 percent chance is higher than the chance of the general population. The increase in risk is due to the very unlikely chance that more of the mother’s egg cells or the father’s sperm cells carry the same change in the gene.

- If one birth parent has the same gene change found in their child, the chance of having another child who has the syndrome is 50 percent.

For a symptom-free sibling, a brother or sister, of someone who has SETD2-related syndrome, the risk of having a child who has the syndrome depends on the symptom-free sibling’s genes and their parents’ genes.

- If neither parent has the same gene change found in their child who has the syndrome, the symptom-free sibling has a nearly 0 percent chance of having a child who has SETD2-related syndrome.

- If one birth parent has the same gene change found in their child who has the syndrome, the symptom-free sibling has a small chance of also having the same gene change. If the symptom-free sibling has the same gene change as their sibling who has the syndrome, the symptom-free sibling’s chance of having a child who has SETD2-related syndrome is 50 percent.

For a person who has SETD2-related syndrome, the risk of having a child who has the syndrome is about 50 percent.
How many people have SETD2-related syndrome?

As of 2019, about 10 people in the world with changes in the SETD2 gene had been described in the medical literature. The first case of SETD2-related syndrome was described in 2012. Scientists expect to find more people who have the syndrome as access to genetic testing improves.

Do people who have SETD2-related syndrome look different?

Some people who have SETD2-related syndrome may have a large head.

8 out of 9 people had a large head, also called macrocephaly.
How is SETD2-related syndrome treated?

Scientists and doctors have only just begun to study SETD2-related syndrome. At this point, there are no medicines designed to treat the syndrome. A genetic diagnosis can help people decide on the best way to track the condition and manage therapies. Doctors can refer people to specialists for:

- Physical exams and brain studies.
- Genetics consults.
- Development and behavior studies.
- Other issues, as needed.

A developmental pediatrician, neurologist, or psychologist can follow progress over time and can help:

- Suggest the right therapies. This can include physical, occupational, speech, or behavioral therapy.
- Guide individualized education plans (IEPs).

Specialists advise that therapies for SETD2-related syndrome should begin as early as possible, ideally before a child begins school.

If seizures happen, consult a neurologist. There are many types of seizures, and not all types are easy to spot. To learn more, you can refer to resources such as the Epilepsy Foundation’s website: www.epilepsy.com/learn/types-seizures.
SETD2-related syndrome is very rare. Doctors and scientists have just recently begun to study it. As of 2019, studies described around 10 people who have SETD2-related syndrome.

This section includes a summary of information from major published articles. It highlights how many people have different symptoms. To learn more about the articles, see the Sources and references section of this guide.

**Behavior and development concerns linked to SETD2-related syndrome**

**Behavior**
About 3 out of 4 of people who have SETD2-related syndrome have autism.

**Speech**
About 1 out of 2 have speech delay.

**Learning**
Almost 1 out of 2 have intellectual disability.

In a study of 9 people who have SETD2-related syndrome:

- 7 out of 9 had Autism
- 5 out of 9 had Speech delay
- 4 out of 9 had Intellectual disability
Medical and physical concerns linked to SETD2-related syndrome

**Growth**

People who have SETD2-related syndrome may have a **larger head size and weigh more than others of the same age.** This is sometimes called overgrowth.
Simons Searchlight is another research program sponsored and run by the Simons Foundation Autism Research Initiative, also known as SFARI. As part of the next step in your research journey, Simons Searchlight offers you the opportunity to partner with scientists and other families who have the same gene change. Simons Searchlight is a registry for more than 200 genetic changes that are associated with neurodevelopmental conditions, including autism spectrum disorder. Simons Searchlight makes it easier for researchers to access the information they need to advance research on a condition.

To register for Simons Searchlight, go to the Simons Searchlight website at [www.simonssearchlight.org](http://www.simonssearchlight.org) and click “Join Us Today”.
